METHOD OF ADJUSTMENT

NOTE: Before servicing PUX-027 POWER AMP P.C.B., be sure discharge Capacitor C1 and C2 (33,000 μ F) through resistor.

N.B: When cross point of R213 and R214 (100k Ω) on PUX-027 POWER AMP is short circuited to ground, output from differential amplifier which consists of TR53 and TR54 (μ PA68H) will stop, and usually no idle current exists in the power transistor. Then, in the event excessive current, due to Class A bias circuit malfunction prior to TR53, 54 stage, exists at Power Transistors, ground the above mentioned cross point to locate the trouble.

1. PUX-027 (POWER AMP PCB) CLASS A BIAS CIRCUIT ADJUSTMENT

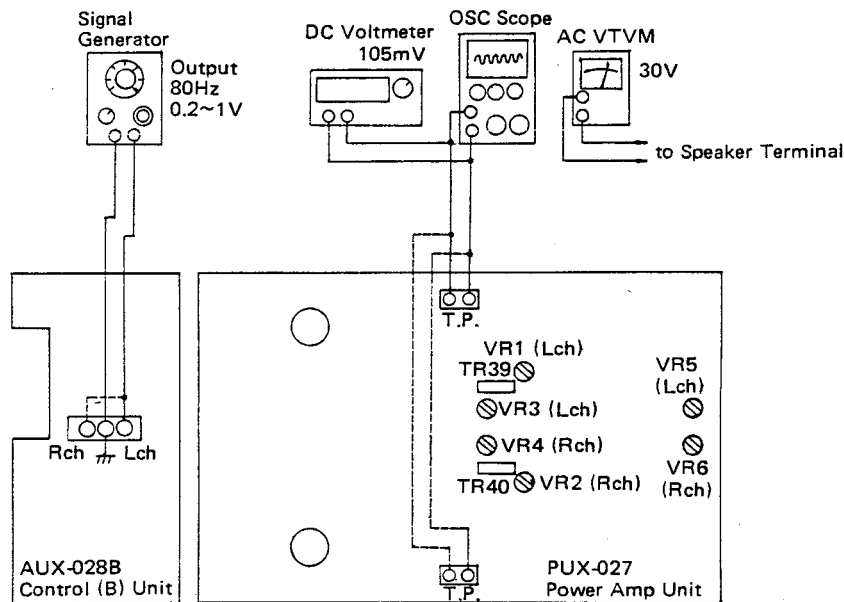

Fig. 1

- (1) **Attenuator Balance Adjustment** (Remove Equalizer Amp P.C.B.; AUE-008 and detach shield case so as the partsside of PUX-027 is visible).
 - 1 Set each switch as per,
POWER \rightarrow off, VOLUME \rightarrow $-\infty$ dB, MODE \rightarrow normal
LOUDNESS \rightarrow off, MUTING \rightarrow 0 dB, BALANCE \rightarrow center
DIRECT COUPLE \rightarrow direct, SPEAKERS \rightarrow A+B
SP. IMP. \rightarrow HIGH (BACK PANEL)
 - 2 Connect measuring instruments as per, (Refer to Fig. 1.)
 - Signal generator to 9 10 11 terminals of AUX-028 (Control B).
 - Set the S.G. output to 0.2 ~ 1V, 80Hz.
 - Connect DC voltmeter and Oscilloscope to T.P. terminals of PUX-027.
 - Connect AC voltmeter only to speaker terminal.
 - 3 Turn power switch on. After one minute, adjust VR5 (L CH) and VR6 (R CH) so as DC voltage at T.P. terminal shows 105mV.
 - 4 Connect bases of TR39 (L CH) and TR40 (R CH) (μ PA77V) together.
Adjust VOLUME so as the voltage at speaker terminal shows 30V.
Observing Oscilloscope, adjust VR1 (L CH) and VR2 (R CH) so as AC voltage at T.P. terminals become minimum (smaller than 10 mVp-p).
Then, remove the connection from bases of TR39 (L CH) and TR40 (R CH), and adjust VR3 (L CH) or VR4 (R CH) so as AC voltage at T.P. terminals become minimum (smaller than 20 mVp-p).

(2) **Idling Current Adjustment** (Set the unit upright, and do not remove bottom cover and EQ shield case.)

- 1 Set each switch as per,
POWER → off, VOLUME → $-\infty$ dB,
SPEAKERS → off, SP. IMP → HIGH (BACK PANEL)
- 2 Connect DC voltmeter to T.P. terminals of PUX-027. (solder DC voltmeter leads to T.P. terminals, or use a pair of jig through available space between power radiator and EQ shield case to extend T.P. outward.)

Fig. 2

- 3 Turn power switch on. After 2 to 5 minutes, adjust VR5 (L CH) and VR6 (R CH) so as the terminal voltage shows 105 ± 5 mV. Insert a — screwdriver through the holes on back panel to adjust VR5 and VR6.

Fig. 3

2. EQUALIZER AMPLIFIER NEUTRAL ADJUSTMENT

- 1 Set each switch as per,
PHONO-1 INPUT JACK → Insert Short Pin
TAPE-1 REC INPUT JACK → Connect DC voltmeter
INPUT SELECTOR → PHONO-1 MM
REC OUT SELECTOR → off, POWER → off
- 2 Turn power switch on. After 10 seconds, set REC OUT SELECTOR to SOURCE, and after 3 minutes, adjust VR1 (L CH) and VR2 (R CH) on the Equalizer servo P.C.B. so as the DC voltage at REC terminal shows 0 ± 0.5 mV. (Refer to Fig. 4.)

PRECAUTION TO USE PMA970

1. RADIO RECEPTION

When connecting AM, FM tuner to the unit, it is preferable to place the tuner more than 10cm away from the PMA970 unit. It is especially true when the Field Strength is weak, since the small pulse noise from the PMA970 could be amplified in the tuner and come out through speaker.

2. SPEAKER IMPEDANCE MATCHING

Use care to match speaker system impedance to that of the Unit. Observe the table below.

Table 1

Speaker switching Impedance switching and speaker impedance	High	Low
System A	8 ~ 16Ω	4Ω
B	8 ~ 16Ω	4Ω
A+B	16Ω	8Ω

The unit is designed to work at Class A characteristic curve with the load impedance listed above. In the event the load impedance is low, bias current will increase and temperature of power transistors will rise.

- 2-1 To hook 8 to 16Ω speaker system, with speaker switch set to A or B, use "High".
- 2-2 To hook two pairs of 8Ω speaker systems, set speaker switch on the front panel to A+B, and set speaker impedance switch on the back panel to "Low".
- 2-3 To hook 4Ω speaker system, with speaker switch set to A or B, use "Low".
- 2-4 NEVER HOOK 4Ω speaker systems to A and B and operate A+B at the same time, or could invite power amplifier damage due to excessive current and heat rise.
Positively observe the instruction above. In the event of mismatching, protector flashes warning LED. Then, turn power switch off, and see to it and correct the mismatching.

3. PRECAUTION TO USE HEAD PHONE

Low, High is switchable to HEAD PHONE impedance, and also DIRECT switching to power amplifier is provided to fully use the best performance of HEAD PHONE. However, wrong connection could invite damage to ear as well as HEAD PHONE due to intense sound.

- 3-1 Always set Main Volume to MIN prior to use HEAD PHONE.
- 3-2 Set impedance switch to HEAD PHONE impedance. (100W + 100W output could be delivered to HEAD PHONE terminals, on Direct position)
- 3-3 Gradually turn Main Volume to the desired sound level.
- 3-4 When not using HEAD PHONE, be sure to set impedance switch to OFF or Low.

PROTECTOR AND PRINCIPLE OF FUNCTION

It provides a function to protect expensive speaker system from possible damage which due to power switch on/off surge, amplifier malfunction and abnormal temperature rise of the power radiator, by isolating the speaker system from power amplifier output.

It consists of an IC which covers all function. Refer to figure 6.

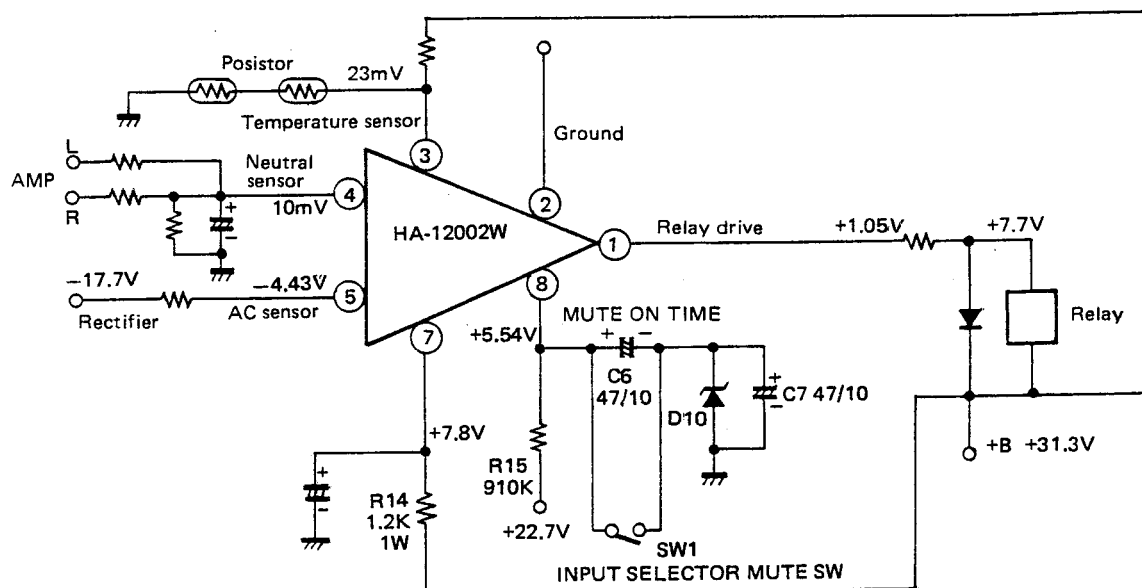

Fig. 6

- **Mute ON Time**

PIN 8 of IC determines OFF/ON time of MUTING. Relay turns ON about 6 ~ 8 seconds after the power source switch turned on, according to time constant determined by R15, C6 and C7.

When power switch is turned on with MC, MM position, click output voltage from Equalizer is applied to PIN 4 of IC, and MUTING TIME is elongated, which delays MUTING TIME at the Main volume.

Also, when INPUT SELECTOR MUTE SW is pressed C6 is shorted momentarily, and 1.5V which determined by D10, is applied to PIN 8 and activates the relay (OFF), and after about 1 ~ 2 seconds, relay turns on in relative to charging time constant.

- **Neutral Sensor**

When more than $\pm 1.2V$ DC is applied to Pin 4 of IC, the relay activates (OFF).

- **Temperature Sensor**

In the event RADIATOR temperature rises above $105^{\circ}C$, posistor activates the relay (OFF).

- **AC Sensor**

When power switch turned off, voltage at Pin 5 of IC drops to 0, and activates relay (OFF).

WIRING DIAGRAM

⚠ Means important safety item, which must be replaced, when necessary, by a part specified or meeting the specification by the manufacturer.

Depending on the area, this circuit diagram varies as shown in the figure below.

NOTES:
ALL RESISTANCE VALUES IN OHM, K=1,000 OHM, M=1,000,000 OHM.
ALL CAPACITANCE VALUES IN MICROFARAD, P=MICRO-MICRO FARAD.
EVERY VOLTAGES AND CURRENTS IS MEASURED AT NO SIGNAL INPUT CONDITION.
CIRCUIT AND PARTS ARE SUBJECT TO CHANGE WITHOUT PRIOR NOTICE.

NOTE:
All voltage values in \square are measured between the specified points and negative (-) polarity power supply source.
Checking of the value in \square must be measured between the specified point and negative (-) polarity power supply source, or damage may occur to the unit.
This schematic diagram is standard and subject to change for improvement without notice.
